

Experiment 1

1. Aim

To demonstrate the use of **inline, internal, and external JavaScript**, use JavaScript **console methods**, and create a webpage that displays a **welcome message** and provides a link to view **student information**.

2. Software/Tools Required

- Visual Studio Code (VS Code) or Notepad++
- Web Browser (Google Chrome, Microsoft Edge, or Mozilla Firefox)
- HTML
- JavaScript

3. Code

```
<!DOCTYPE html>
<html>

  <title>
    Website
  </title>

  <body>
    <h1>
      Symbiosis Institute of Technology

    </h1>
    <h2> Department of Computer Science</h2>
    <p> Click on the link below to view Student Information: </p>
    <br>
    <a href="students.html" class="btn">Student Information Page</a>
    <br><br>
<button style="padding: 15px 30px; font-size: 18px; background-color: #4428a7; color: white; border: none; border-radius: 4px; cursor: pointer;">
  Announcements
</button>
<script>
  alert("Welcome to SIT Nagpur");
</script>
  </body>

</html>
```

JavaScript is a scripting language used to make web pages interactive.

- **Inline JavaScript:** JavaScript written directly inside an HTML element using attributes like `onclick`.
- **Internal JavaScript:** JavaScript written inside the `<script>` tag within the HTML file.
- **External JavaScript:** JavaScript written in a separate file and linked using the `<script src="file.js">` tag.

- **Console Methods:** Methods such as `console.log()`, `console.warn()`, and `console.error()` display messages in the browser's console.

the browser's Developer Console for debugging.

In this program, an **alert box** displays the message **"Welcome to SIT Nagpur"** when the webpage loads. The page also displays the institute name, department name, a link to the Student Information page, and an Announcements button.

4. Output
